DISCLAIMER

It is up to the customer to verify fitness for use, as UPM Raflatac has no control over inks, printer settings and expectations of image durability. If a product featuring one of the face materials listed above works in a particular printer model, all other products constructed with that face stock should work as well, unless the adhesive creates an issue with the hot fusing technologies. If products are not designated to be compatible with certain printers, it may be that they have not yet been tested for those machines.
